700R-4 Transmission Cooler Lines

INSTALLATION INSTRUCTIONS

On the 700R4 the bottom fitting on the right side of the transmission is the "out" line to the cooler and the top fitting is for the return line from the cooler.

Our kit is composed of 3 lines:

- (A) 46" Long with 45deg ends
- (B) 56" Long with 45deg and straight end
- (C) 7.5" Long with 90deg and straight end

Hose (A) connects the out line on the transmission to the inlet fitting on the stock radiator (bottom fitting). Hose (C) connects the outlet of the stock radiator (top fitting) to the top of the B&M Auxiliary cooler. Hose (B) then connects the bottom of the auxiliary cooler to the top fitting on the transmission.

*** Note: The bottom line can be routed through the stock core support hole, and the top line will likely need a new hole or enlarged hole depending on the location of the auxiliary cooler. If the A/C has been removed the lines can be run on the engine side of the core support.**

WITH A/C (THROUGH CORE SUPPORT)

WITHOUT A/C (BEHIND CORE SUPPORT)
